# Pooling: Shrinking the image stack

1. Pick a window size (usually 2 or 3).
2. Pick a stride (usually 2).
3. Walk your window across your filtered images.
4. From each window, take the maximum value.

# Normalization

Keep the math from breaking by tweaking each of the values just a bit.

Change everything negative to zero.

These can also be stacked.

# Putting it all together

A set of pixels becomes a set of votes.

# Hyperparameters (knobs)

Convolution

- Number of features

- Size of features

Pooling

- Window size

- Window stride

Fully Connected

- Number of neurons

# Architecture

How many of each type of layer?

In what order?

# Images

# Columns of pixels ➔

Rows of  
pixels

Words in  
dictionary

# Limitations

ConvNets only capture local “spatial” patterns in data.  
If the data can’t be made to look like an image,  
ConvNets are less useful.

# Customer data

Name, age,  
address, email,  
purchases,  
browsing activity,...

# Rule of thumb

If your data is just as useful  
after swapping any of your  
columns with each other, then  
you can't use Convolutional  
Neural Networks.

## In a nutshell

ConvNets are great at finding patterns and using them to classify images.
